

CANONICAL SPEC SHEET

Social Enterprise Canvas
(SEC) Mapping Tool

The Enterprise Synthesis & Coherence layer of the DALE architecture. This document is the canonical specification for the SEC covering purpose, activation logic, pipeline position, the 7-phase process, canonical outputs, and integration requirements.

Stage	Activation	Feeds into	Version
Realize	Conditional - Runner determines	CBC or hybrid	1.0.0 · April 2026

SECTION 1

What SEC Is — Purpose and Canonical Role

The Enterprise Synthesis Layer

SEC is the enterprise synthesis and coherence layer of the DALE architecture. It organizes traceable structural outputs into enterprise operating architectures, flow systems, stewardship structures, continuity systems, delivery architectures, and scale and governance readiness structures.

SEC does not begin with ideas. It begins with structured system signal already processed through CoS observation, ECOA observational

What SEC Determines

SEC's purpose is to determine whether a value model can:

- Hold together as an operating system
- Operate coherently under real-world conditions
- Sustain itself over time
- Adapt under pressure
- Retain alignment between value, impact, and resourcing

i "SEC does not invent coherence. It surfaces whether coherence exists, where it is fragile, and what remains unresolved."

structuring, ARA resolution, and Runner execution logic.

SEC ensures that enterprise models are not imagined independently from reality, but synthesized from traceable system conditions.

How SEC Came to Be

SEC emerged from repeated observation that many enterprises especially in social impact and localization contexts— fail not because of weak intentions, but because the relationship between value, impact, money, governance, leadership, delivery, and continuity is never structurally mapped.

Traditional models often separate:

- Revenue from impact
- Delivery from governance
- Growth from continuity
- Data from decision-making

This creates systems that appear functional externally but become fragile under operational stress.

SEC was developed to:

- Make enterprise coherence observable and traceable before scale, funding, or formalization occurs
- Extend the DALE architecture from observing systems (CoS) into synthesizing stewardable operating systems
- Expose tensions before they become system failure

What SEC Entails vs. What It Does Not

SEC INVOLVES	SEC DOES NOT INVOLVE
Organizing traceable enterprise structures	Inventing enterprise ideas detached from system reality
Mapping value, impact, money, data, and decision flows	Producing polished investor narratives
Identifying operational tensions and dependencies	Assuming coherence without traceability
Structuring enterprise operating architecture	Replacing CoS, ECOA, ARA, or Runner
Exposing bottlenecks and continuity risks	Hiding fragility to make the model appear stronger

Preparing enterprise structures for stewardship and formalization	Jumping directly into scaling or implementation
Preserving unresolved conditions explicitly	Treating missingness as complete resolution

SECTION 2

Pipeline Position & Activation Logic

Layer Roles

LAYER	ROLE	REALIZATION TYPE TAG	MEANING
CoS	Captures system signal	RT-SEC	Enterprise realization required
ECOA	Assigns observational structure	RT-CBC	Governance formalization required
ARA	Resolves structural conditions	RT-H	Hybrid enterprise + governance realization
Runner	Produces operational emergence states. Determines realization pathway.	RT-U	Realization pathway unresolved
SEC	Synthesizes enterprise coherence	—	—
CBC	Formalizes negotiated value exchange	—	—

i ECOA defines reality. ARA resolves structure. Runner executes. SEC synthesizes enterprise coherence. CBC formalizes governance and value exchange. No layer substitutes another.

SEC Activation Condition

SEC is NOT automatically activated. Runner determines the required realization pathway based on the resolved structural conditions of the system.

SEC activates only when Runner outputs indicate that any of the following require the formation or restructuring of an enterprise operating architecture:

- Value realization
- Impact continuity
- Operational coordination
- Resourcing
- Stewardship or delivery

The process may transition directly from Runner to CBC (without SEC activation) when resolution can occur through:

- Negotiated governance
- Benefit formalization
- Contractual accountability
- Institutional restructuring
- Without enterprise creation

! SEC does not assume enterprise complexity beyond what the system requires.

SECTION 3

SEC Process Structure - Seven Phases

The SEC process moves through seven phases. Each phase has a defined objective, inputs, outputs, and process actions. No phase produces free-form analysis — every output must be traceable to upstream structural inputs.

#	PHASE	ANALOGY	OBJECTIVE	PRIMARY OUTPUT
1	Structural Intake	Gathering resolved equation components	Absorb traceable outputs from upstream layers	Structural Intake Package (SIP)
2	Realization Framing	Determining enterprise structure requirements	Define enterprise realization boundaries	Enterprise Structure Set (ESS)

#	PHASE	ANALOGY	OBJECTIVE	PRIMARY OUTPUT
3	Enterprise Flow Synthesis	Mapping movement through the enterprise	Organize enterprise flows and interactions	Enterprise Flow Map (EFM)
4	Coherence Structuring	Checking whether the structure holds	Surface tensions, dependencies, and bottlenecks	Coherence Structure Map (CSM)
5	Operating Architecture Expression	Writing the operating system	Produce structured enterprise representation	Operating Architecture Expression (OAE)
6	Continuity & Scale Expression	Stress-testing survivability	Surface continuity and scale conditions	Continuity & Scale Map (CSM-2)
7	CBC Transition Readiness	Determining governance formalization needs	Identify downstream formalization requirements	CBC Transition Package (CTP)

PHASE 1 Structural Intake

Absorb and organize all traceable upstream structural outputs required for enterprise synthesis.

i

SEC begins with observed system structures, resolved dependencies, operational emergence states, and admissible enterprise conditions. Not with ideation.

Inputs by Upstream Layer

FROM COS	FROM ECOA	FROM ARA	FROM RUNNER	DOMAIN
Actor Maps	Admissible variables	Resolution states	Execution pathways	Value Domain
Interaction Maps	Operational states	Structural contradictions	Delivery logic	Impact Domain
Issue Landscapes	Fundamental variable assignments	Adaptive configurations	Transition pathways	Resource Domain
System Pattern Maps	Informational absence conditions	Dependency structures	Operational conditions	Delivery Domain

FROM COS	FROM ECOA	FROM ARA	FROM RUNNER	DOMAIN
Visibility Layers	Structural absence conditions	Balance conditions	Realization type (RT-SEC / RT-H)	Governance, Flow, Scale Domains

Process Actions

#	ACTION	DETAIL
1	Gather upstream outputs	Assemble admissible structural records from CoS, ECOA, ARA, and Runner
2	Verify traceability	Ensure all records maintain source paths to original system observations
3	Verify realization pathway	Confirm RT-SEC or RT-H activation from Runner output
4	Identify active enterprise variables	Determine which synthesis domains are activated based on Runner conditions
5	Preserve unresolved conditions	Carry forward missingness, informational absence, and dependency states — do not resolve artificially
6	Organize synthesis intake	Group records into seven enterprise domains: Value, Impact, Resource, Delivery, Governance, Flow, Scale
7	Build Structural Intake Package	Finalize the SIP as the complete enterprise synthesis intake structure

X Unresolved conditions from upstream layers must be preserved explicitly. They are structural inputs, not gaps to be filled.

PHASE 2 Realization Framing

Define the required enterprise operating structure based on Runner outputs.

This Phase Determines

- Whether enterprise coordination is required
- How enterprise value is organized

Output

Enterprise Structure Set (ESS)

- What structures are necessary for continuity
- What enterprise boundaries exist

The first enterprise synthesis layer. Defines the operating structure required not idealized, only what the resolved system conditions indicate.

! SEC does not assume enterprise complexity beyond what the system requires.

Process Actions

#	ACTION	DETAIL
1	Define beneficiary structure	Identify who experiences change from ARA-resolved actor positions
2	Define payer structure	Identify resource-bearing actors distinguish from beneficiary where required
3	Define value structure	Organize value creation pathways traceable to v27 (value) and upstream CoS flows
4	Define impact structure	Organize impact pathways traceable to v28 (impact) and ECOA operational states
5	Define offering structure	Identify operational mechanisms what the enterprise does
6	Define delivery structure	Organize enterprise execution channels, activities, operational architecture
7	Define resource structure	Organize operational dependencies resourcing, cost, revenue architecture
8	Define stewardship structure	Organize continuity responsibilities authority, oversight, accountability
9	Define enterprise boundaries	Clarify operating scope what the enterprise does and does not include

Enterprise Domains and Outputs

DOMAIN	OUTPUT
Beneficiary Domain	Beneficiary structures - who experiences change
Payer Domain	Customer/payer structures - who provides resources
Value Domain	Value proposition pathways
Impact Domain	Impact proposition pathways
Offering Domain	Enterprise mechanisms - what is offered
Delivery Domain	Channels and operational activities

DOMAIN	OUTPUT
Resource Domain	Resources and cost structures
Stewardship Domain	Continuity and responsibility structures

PHASE 3 Enterprise Flow Synthesis

Map movement through the enterprise system.

Four Mandatory Enterprise Flows

SEC recognizes four mandatory enterprise flows. Flow coherence is required for enterprise continuity. All four must be mapped — absence of a flow is a structural finding, not a skip.

FLOW	DESCRIPTION
Money Flow	Resource movement - how resources enter, move through, and exit the enterprise
Impact Flow	Change movement - how the enterprise produces and sustains impact
Data Flow	Information movement - how information is captured, used, and shared
Decision Flow	Authority movement - how decisions are made and by whom

Output

Enterprise Flow Map (EFM)

A complete map of all four flows showing intersections, tensions, and dependency structures.

i

Flow intersections are where reinforcement or fracture occurs. Both must be recorded. Flow tensions are not problems to be solved here they are structural findings to be preserved.

Process Actions

#	ACTION	DETAIL
1	Map money flow	Identify all resource movement - revenue, grants, in-kind, redistribution
2	Map impact flow	Identify all change movement - theory of change pathways, outcome chains
3	Map data flow	Identify all information movement- capture, processing, use, feedback
4	Map decision flow	Identify all authority movement -formal and informal decision structures
5	Identify flow intersections	Surface points where flows reinforce or fracture each other
6	Capture flow tensions	Record contradictions and disconnections between flows - these are structural findings
7	Preserve flow dependencies	Maintain traceable relationships between flows and upstream structural conditions

PHASE 4 Coherence Structuring

Determine whether the enterprise operating structure holds together under real-world conditions.

What This Phase Surfaces

- Tensions between enterprise elements
- Bottlenecks limiting continuity
- Continuity risks
- Founder dependence
- Mission drift conditions

- Unresolved structural dependencies

X SEC does not fabricate coherence. If tensions are unresolved, they are recorded as unresolved — not smoothed over.

Coherence States

TAG	STATE
RES-C	Coherent
RES-F	Fragile
RES-U	Unresolved
RES-D	Dependency exposed
RES-B	Bottleneck exposed
RES-MD	Mission drift risk
RES-FD	Founder dependent
RES-CR	Continuity risk exposed

Process Actions

#	ACTION	DETAIL
1	Evaluate value coherence	Does value logic align with delivery structure? Are value pathways operationally supported?
2	Evaluate impact coherence	Does impact logic connect to operations? Is impact traceable through the enterprise?
3	Evaluate resource coherence	Does resourcing support continuity? Are revenue and cost structures aligned?
4	Evaluate governance coherence	Can authority function beyond founder dependence? Is decision-making distributed?
5	Evaluate flow coherence	Do the four enterprise flows reinforce each other? Where do they fracture?
6	Identify bottlenecks	Surface structural constraints limiting enterprise continuity or scale
7	Identify continuity risks	Surface survivability conditions — what threatens the enterprise over time?
8	Preserve unresolved tensions	Explicitly record incompleteness and fragility — do not resolve artificially

PHASE 5

Operating Architecture Expression

Produce the structured enterprise operating architecture.

What This Phase Converts

This phase converts synthesized enterprise structures into:

- Readable operating architecture
- Traceable operating systems
- Stewardship-ready representations

All representations must remain traceable to Phase 1–4 synthesis outputs. No new enterprise ideas enter at this stage.

Output

Operating Architecture Expression (OAE)

A structured, layered representation of the enterprise operating system with full synthesis traceability.

Process Actions

#	ACTION	DETAIL
1	Build architecture layers	Organize the enterprise system into front-stage, back-stage, partnership, and leadership layers
2	Organize front-stage systems	Capture visible enterprise structures - what the enterprise presents and delivers externally
3	Organize back-stage systems	Capture operational systems - what the enterprise requires internally to function
4	Organize partnership architecture	Capture dependency structures - relationships required for enterprise function
5	Organize leadership architecture	Capture authority structures - how the enterprise is governed and stewarded
6	Preserve traceability	Maintain synthesis paths from OAE elements to upstream phases and source observations
7	Preserve unresolved conditions	Keep fragility, dependencies, and unresolved tensions visible in the architecture expression

PHASE 6

Continuity & Scale Expression

Stress-test survivability under growth and operational pressure.

Scale Pathway Types

- Replication - duplicating the model elsewhere
- Network - connecting nodes into a coordinated system
- Franchise - licensing structure and brand
- Policy - embedding in institutional systems
- Hybrid - combining multiple pathways

Output

Continuity & Scale Map (CSM-2)

A structured assessment of survivability under growth and operational pressure, with explicit visibility of unresolved conditions.

Survivability missingness - conditions that are unresolved at this stage - must be recorded explicitly and carried into the CBC Transition Package.

Continuity Risk Categories

- Operational risks - what threatens daily function
- Financial risks - what threatens resource sustainability
- Legitimacy risks - what threatens trust and accountability
- Founder risks - what threatens continuity beyond key individuals

Process Actions

#	ACTION	DETAIL
1	Identify scale pathways	Determine applicable scale type: Replication / Network / Franchise / Policy / Hybrid
2	Identify continuity risks	Surface operational, financial, legitimacy, and founder risks
3	Evaluate founder dependence	Determine the degree of authority concentration in key individuals
4	Evaluate governance resilience	Assess whether distributed authority structures can sustain the enterprise
5	Identify scale breakpoints	Surface the specific points at which scaling creates fragility or system failure
6	Preserve survivability missingness	Record all unresolved continuity conditions — do not project resolution that has not been demonstrated

PHASE 7 CBC Transition Readiness

Determine what requires governance formalization, negotiated exchange, or accountability structuring.

What SEC Identifies (Not Formalizes)

SEC does not formalize governance. It identifies:

- What requires formalization
- Where negotiated structures are necessary
- Where accountability must be structurally protected

i

Governance formalization is the role of CBC. SEC prepares the downstream intake - it does not perform the formalization itself.

Output

CBC Transition Package (CTP)

The complete downstream intake structure for CBC. Includes all governance-bearing structures, accountability dependencies, stewardship obligations, measurement requirements, and continuity protections identified through SEC synthesis.

Process Actions

#	ACTION	DETAIL
1	Identify governance-bearing structures	Determine which enterprise structures require formal governance or contractual protection
2	Identify negotiated value exchange conditions	Surface accountability dependencies that require formal negotiation or agreement
3	Identify stewardship obligations	Determine responsibility structures that must be formalized - who holds what accountability
4	Identify measurement obligations	Determine traceability requirements - what must be measured and reported
5	Identify continuity protections	Determine governance safeguards required to protect enterprise continuity under pressure
6	Build CBC Transition Package	Prepare the complete downstream CBC intake structure from all Phase 1–6 synthesis outputs

SECTION 4

Canonical Output Structure**Phase Output Chain**

PHASE	OUTPUT	ABBREVIATION	FEEDS INTO
1. Structural Intake	Structural Intake Package	SIP	Phase 2 Realization Framing
2. Realization Framing	Enterprise Structure Set	ESS	Phase 3 Enterprise Flow Synthesis
3. Enterprise Flow Synthesis	Enterprise Flow Map	EFM	Phase 4 Coherence Structuring
4. Coherence Structuring	Coherence Structure Map	CSM	Phase 5 Operating Architecture Expression
5. Operating Architecture Expression	Operating Architecture Expression	OAE	Phase 6 Continuity & Scale Expression
6. Continuity & Scale Expression	Continuity & Scale Map	CSM-2	Phase 7 CBC Transition Readiness
7. CBC Transition Readiness	CBC Transition Package	CTP	CBC tool - governance formalization

SEC Output Record Format

Every SEC output record passed to the unified DALE master dataset must carry the following fields.

FIELD	TYPE / VALUES	DESCRIPTION
ObservationID	String - SEC-YYYYMMDD-XXXXXX	Unique identifier linking this record to the observation instance
SourceTool	"SEC"	Identifies the originating tool
Phase	1–7	SEC phase that produced this record
Layer	synthesis / expression / transition	Architectural layer within SEC
Domain	Value / Impact / Resource / Delivery / Governance / Flow / Scale	Enterprise domain
EntityID	String	Identifies the observed entity or unit
StateID	Output abbreviation (SIP / ESS / EFM / CSM / OAE / CSM-2 / CTP)	Identifies the phase output
CoherenceState	RES-C / RES-F / RES-U / RES-D / RES-B / RES-MD / RES-FD / RES-CR	Structural coherence state where applicable
RealizationType	RT-SEC / RT-CBC / RT-H / RT-U	Realization type from Runner activation
Status	resolved / unresolved / fragile / missing	Synthesis status of this record
TraceRef	String	Backward traceability to upstream CoS / ECOA / ARA / Runner source
UsedPrinciples	Array: P1–P5	Fixed DALE principles governing the synthesis path
ObservationCondition	String	Concrete observation condition from CoS
Timestamp	ISO 8601 datetime	When the record was produced
TracePath	String	Full synthesis path from source observation to this output

SECTION 5

Global Canonical Rule & Architectural Constraints

Tools operate on structure. They do not create it.

SEC inherits this rule directly from the CoS architecture.

Every SEC Output Must

- Remain traceable to upstream structural conditions (CoS, ECOA, ARA, Runner)
- Preserve unresolved tensions - not resolve them artificially
- Maintain explicit structural dependencies
- Avoid fabricated coherence
- Remain admissible within the fixed DALE architecture (P1–P5, M1–M5)

i

SEC organizes enterprise coherence. It does not invent it.

X

Unresolved conditions are structural findings. They must be preserved and carried forward to CBC- not collapsed, resolved prematurely, or omitted from output records.

!

SEC is activated only when Runner determines it. No practitioner decision overrides the realization type determination from Runner.

No SEC structure may exist without:

- Traceable inputs from upstream layers
- Identifiable synthesis logic
- Explicit coherence state (RES-C / RES-F / RES-U / ...)
- Visible dependency conditions

Social Enterprise Canvas (SEC) - Canonical Spec Sheet · v1.0.0

DALE Labs | April 2026 | Confidential

ECOA defines reality · ARA resolve's structure · Runner executes · SEC synthesizes enterprise coherence · CBC formalizes governance and value exchange
